NEBRASKA WEEKLY WEATHER AND CROP REPORT

Release 3/10/69

Week Ending 3/10/69

The cold, cloudy, snowy weather persisted for still another week. Although snow fell somewhere in the State every day of the week, amounts were generally small, except in a few local areas. Temperatures were well below seasonal, averaging about nine degrees below normal in the east to 15 to 18 degrees below normal in the west and north central.

Thawing during the week reduced snow pack, and icy lakes formed on poorly drained fields in eastern and southern areas. Some fall sown crops may be drowned out if these conditions exist very long. Low temperatures and additional snow over the week end will lengthen the period of this cover.

High demands for forage feeds continue, and existing supplies are becoming scarce. Feed grain supplies are mostly adequate, except for the northeast, but muddy roads and yards have caused difficulties in moving these supplies to places where needed. Farmers are experiencing equal difficulties in marketing livestock and produce.

Adverse weather conditions continue to cause problems in livestock operations.

Lambing and farrowing operations are well under way, and calving operations are increasing. Some losses of newborn and young livestock from exposure and disease have been reported. There are also a few deaths of mature animals.

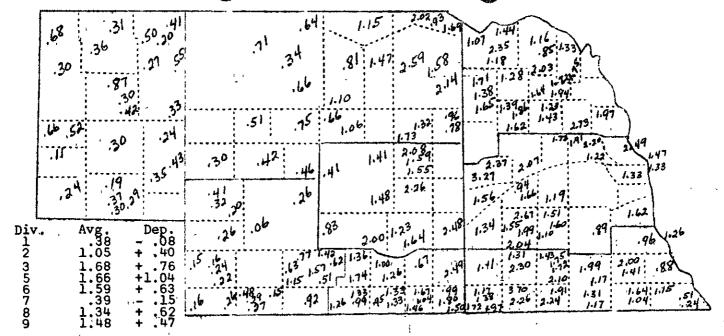

Feed yards are very muddy, and low temperatures over the week end have frozen these into very rough surfaces making it difficult for animals to get around. Some farmers have turned cattle into open fields, but these are also quite muddy and few resting areas exist. Gains on fed cattle are only fair.
